

Analysis of MTA Turnstile Data

The objective of this project is to identify which stations have the most cumulative commuter entries so that City MD can set up COVID-19 testing sites outside of them in order to test the most amount of people in NYC.

This figure depicts the cumulative daily entries on the y-axis and the corresponding stations on the x-axis. These results suggest that City MD should consider placing COVID-19 testing sites outside of these stations if they want to be exposed to the maximum number of commuters. The more people City MD can get into contact with, the more COVID-19 tests they can conduct and ultimately help stop the spread.
